EXPERIMENT 09

Exploring AI-Assisted Features and Built-In Analytics (Zia) in Zoho Creator

---

Project: Insurance Claim Management System

Name	Pavithra Narayanan
Roll No	241401064
Department	CSBS

241401064

Aim

To explore the AI-assisted and built-in analytics capabilities of Zoho Creator, powered by Zia, Zoho's AI assistant, by reviewing the dashboard, conditionally formatted reports, and Kanban-grouped views of the Insurance Claim Management System, and to understand how these features turn raw form data into actionable visual insight without writing custom code.

Objectives

- To review the application dashboard and its summary tiles and charts for insurance claim data.
- To study how conditional formatting highlights values such as Claim Type or Claim Status with colour so patterns are visible at a glance.
- To study Kanban report views as a built-in way to group and visualise claim records without any scripting.
- To review the Claim Request Report as the structured data these analytics are built on.
- To understand Zia's role within Zoho Creator in suggesting chart types, generating dashboard layouts, and surfacing patterns in application data.

Software / Tools Required

- Zoho Creator (web-based low-code application development platform)
- Insurance Claim Management System application
- Web browser with an active internet connection
- Zoho account with access to the application in Access/Live mode

Introduction / Theory

Built-In Analytics in Zoho Creator

Zoho Creator includes analytics components that turn form records into visual summaries without any separate BI tool. A Dashboard page can combine summary tiles, pie and bar charts, and embedded reports in one view; individual reports can use conditional formatting to colour rows or cells by field value; and a Kanban report groups records into columns by a chosen field. All of these read live data directly from the application's forms, so the visuals update automatically as records are added or changed.

Zia — Zoho's AI Assistant

Zia is the AI layer built into the Zoho ecosystem, including Creator. Within Creator, Zia-driven features assist application builders by suggesting appropriate chart types for a given report, helping generate dashboard layouts from existing forms, and surfacing trends that would otherwise need

24140164

manual analysis. Rather than requiring the developer to hand-code every chart, Zia-assisted suggestions speed up the process of turning a plain data table into a meaningful visual summary.

Key Concepts

Concept	Description
Dashboard	A custom page combining summary tiles, charts, and embedded reports into a single, auto-refreshing overview of application data.
Chart Widget	A visual element (pie, bar, donut, etc.) bound to a report that summarises records by a chosen field, such as Claim Type or Claimant Type.
Conditional Formatting	A report-level rule that colours a cell or row automatically based on its value, making important values stand out without manual review.
Kanban Report	A board-style report that groups records into columns by a selected field (e.g. Claim Type), letting staff scan records visually.
Zia Insights	AI-assisted suggestions within Zoho Creator that recommend chart types, help assemble dashboard layouts, and highlight patterns in the underlying data.

Application Specifications

Parameter	Detail
Application Name	Insurance Claim Management System
Primary Form	Insurance Claim Request Form (Claim_Request_Form)
Dashboard Elements	Summary tiles (e.g. total claims) and chart widgets (e.g. claims by Claim Type)
Conditionally Formatted Report	Claim_Request_Report (coloured by Claim Type or Claim Status)
Kanban Report	Claims grouped by Claim Type
Data Report	Claim_Request_Report — Claimant Name, Policy Number, Claim Type, Date of Incident, Claim Amount, Claimant Type, Contact Number

24A01064

Procedure

1. Open the application dashboard

The Insurance Claim Management System was opened in Access mode and its Dashboard was reviewed. The dashboard summarises claim records into tiles and charts using live form data.

2. Inspect the conditionally formatted report

The Claim_Request_Report was opened and conditional formatting was applied so that a chosen column, such as Claim Type, is colour-coded automatically by value.

3. Switch to the Kanban view

A Kanban report was opened, grouping the claim records into columns by Claim Type.

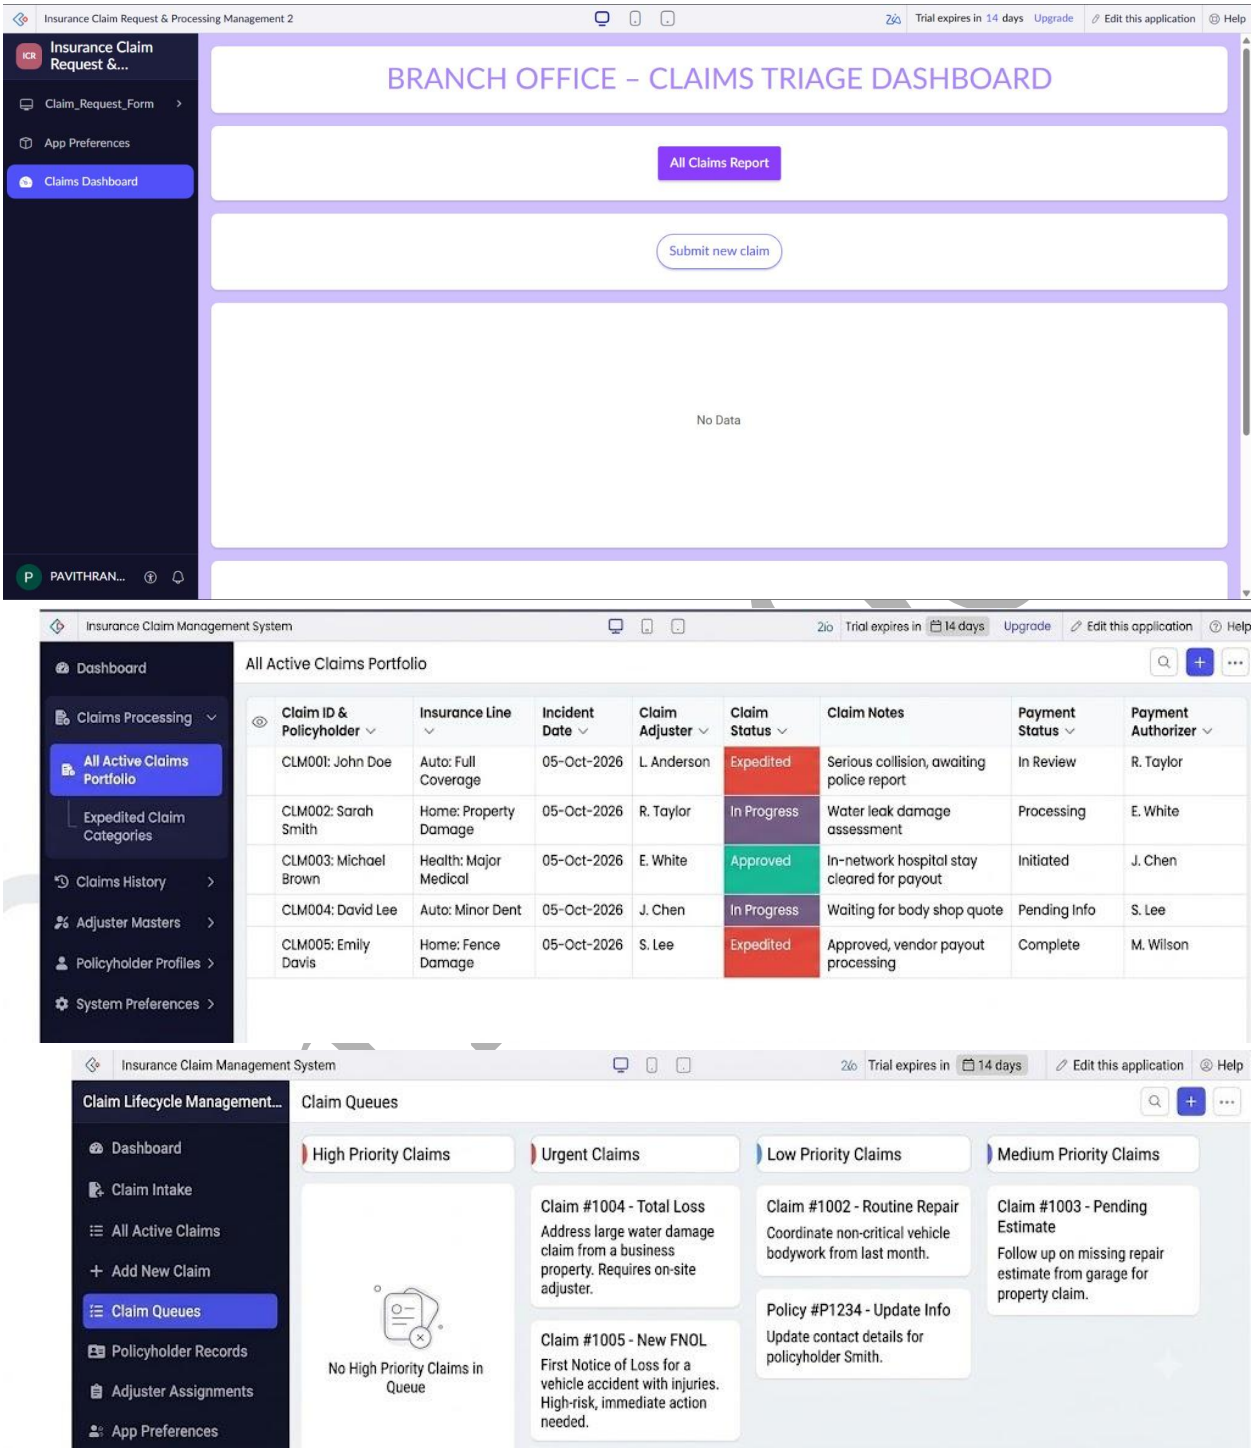

4. Review the chart widgets

The chart widgets on the dashboard were reviewed to see how claims are distributed by a chosen field, and the chart type suggested by Zia was observed where available.

5. Review the underlying claim data

The Claim_Request_Report was reviewed to confirm the structured data (claimant, policy number, claim type, amount, date) that the dashboard and Kanban views are built on.

24140164

Result

- The Insurance Claim Management System's Dashboard was reviewed, confirming it summarises claim data into live tiles and charts without manual configuration.

- Conditional formatting was applied to the Claim_Request_Report, colouring values automatically to highlight patterns.
- A Kanban report view was reviewed, confirming claim records can be grouped and browsed visually by a chosen field.
- The Claim_Request_Report was reviewed as the structured data underlying these analytics.

Conclusion

The experiment demonstrated how Zoho Creator's built-in analytics and Zia-assisted features convert plain form records into decision-ready visuals with no custom charting code. The dashboard's tiles and charts give an instant overview of claim volume and distribution, conditional formatting turns a flat table into a scannable map of claim types, and Kanban reports let the claims team browse the same data as a visual board. Together these features show that low-code analytics in Zoho Creator is a natural extension of the same forms and reports built in earlier experiments.
