Zoho Creator Low-Code Architecture

The Zoho Creator low-code architecture is a platform-based architecture that allows users to build applications with minimal coding. It consists of multiple layers where the user interface layer provides forms, pages, reports, and dashboards for users to interact with the application. The application layer contains workflows, automation rules, and Deluge scripts that handle business logic and process automation. The data layer stores and manages application data using Zoho Creator's built-in database, including forms and records. The platform also provides an integration layer that connects with external services, APIs, and other Zoho applications. This architecture enables rapid application development, easy customization, automation, and efficient data management without requiring traditional software development methods.

1. Application

- These are the actual apps you create.
- Example: CRM app, library app, inventory app.
- Each application contains its own data and features.

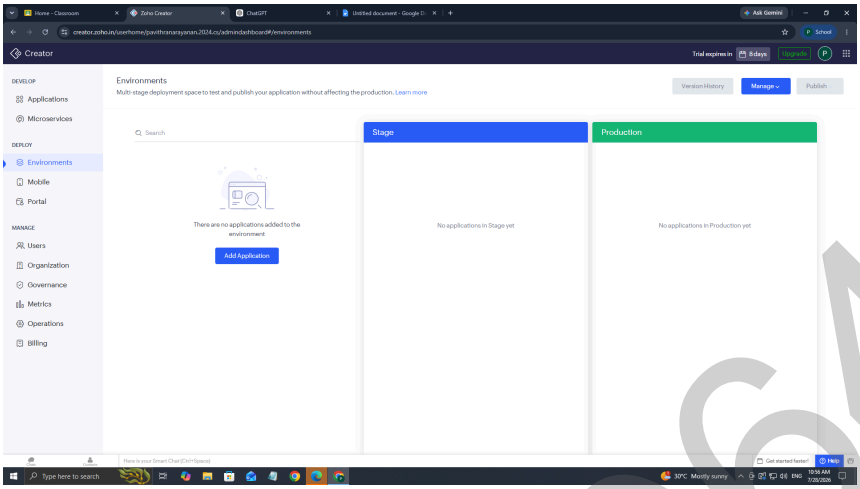

2. Microservices

- Small independent services that perform specific tasks.
- They help apps communicate and handle different functions separately.

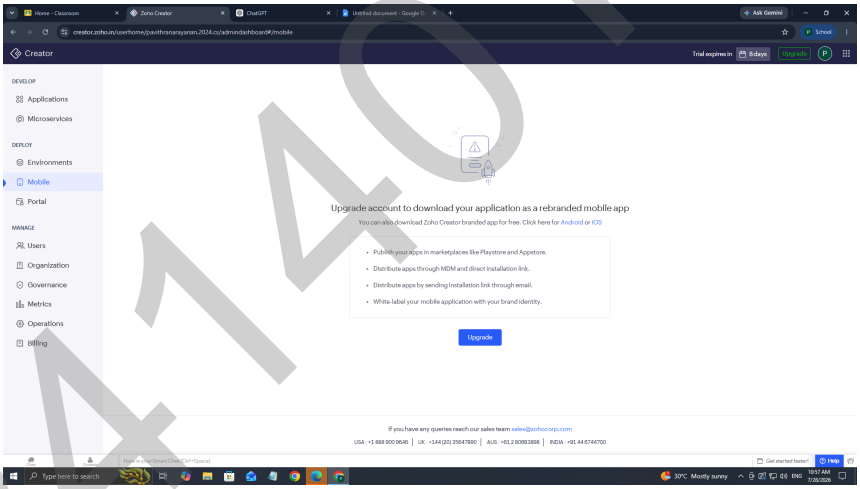

241401064

3. Environments

- Separate spaces for building and testing apps.
- Example: Development environment for creating and Production environment for real users.

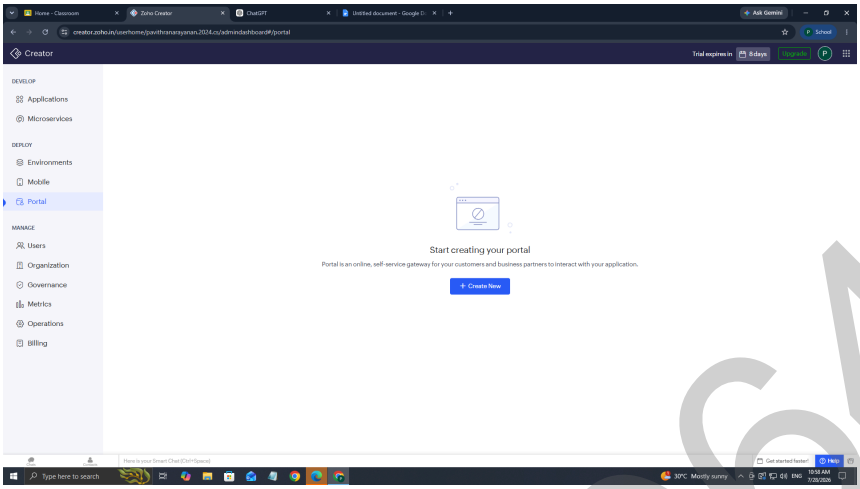

4. Mobile

- Allows applications to work on smartphones and tablets.
- Users can access apps through mobile devices.

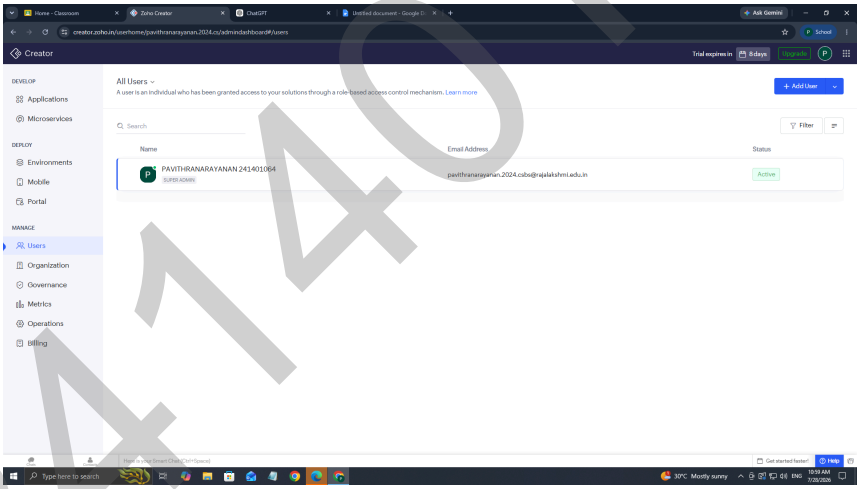

2414010064

5. Portal

- Provides a dedicated access area for external users.
- Example: customers, partners, or clients can log in and use the app.

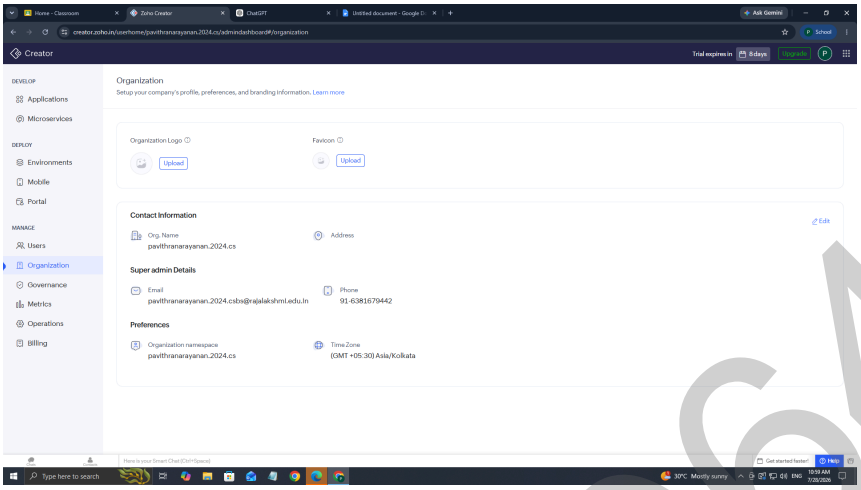

6. Users

- Controls who can access the platform.
- Allows adding users and assigning permissions.

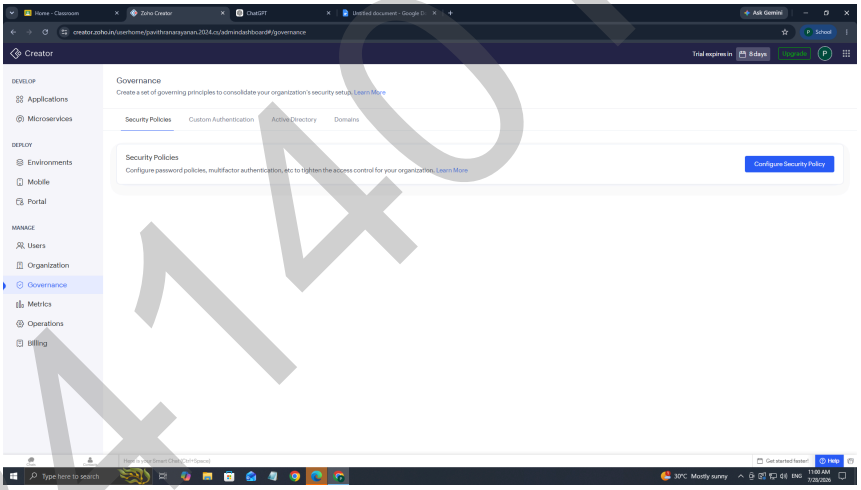

241401064

7. Organization

- Manages company settings and structure.
- Controls departments, teams, and account information.

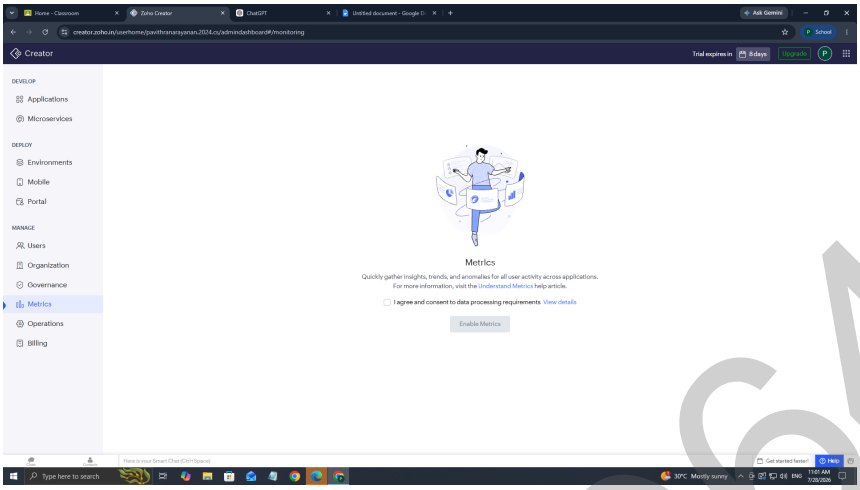

8. Governance

- Ensures apps follow rules and policies.
- Helps manage security, compliance, and proper usage.

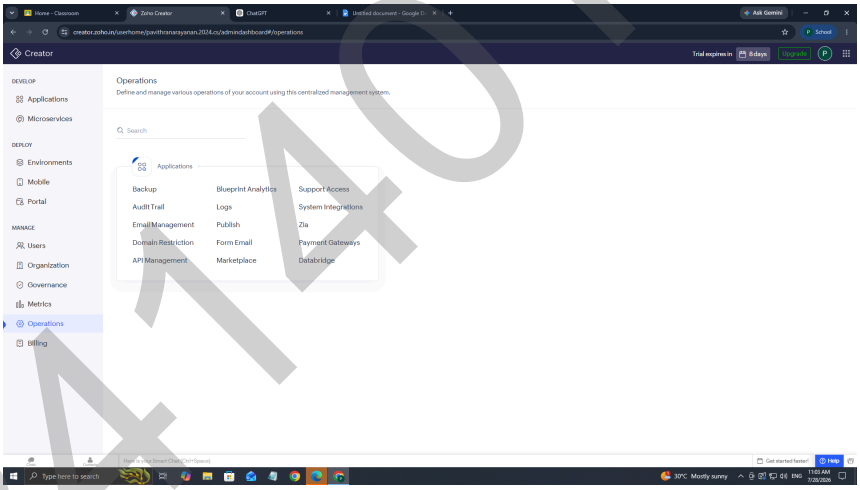

2140164

9. Metrics

- Tracks application performance.
- Shows usage statistics and reports.

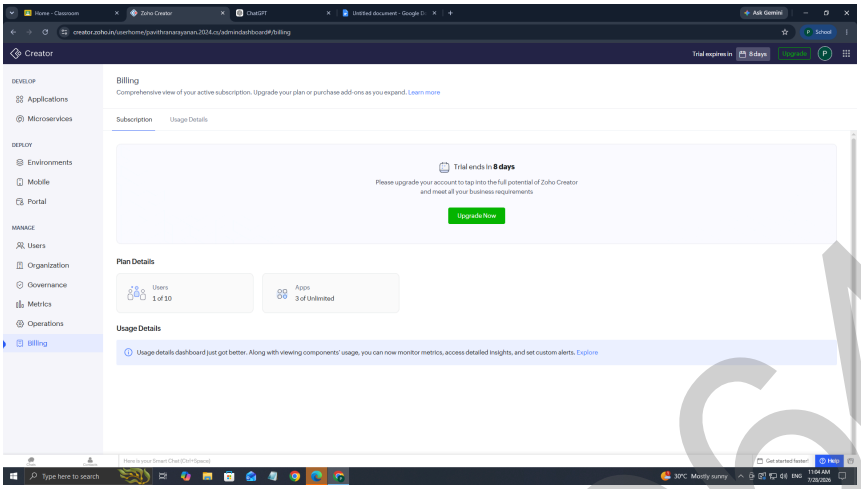

10. Operations

- Handles daily management of applications.
- Monitors app performance, errors, and maintenance.

2140164

11. Billing

- Manages subscription plans and payments.
- Tracks usage and costs.
