# 1. Aim

To automate the insurance claim submission process in the Insurance Claim Management application using Zoho Creator workflows and Deluge scripting. The main objective is to automatically send a confirmation email to the claimant when an insurance claim request is successfully submitted.

This automation reduces manual work, improves communication between the insurance company and the claimant, and ensures that customers receive immediate confirmation of their claim submission. Application testing and debugging are performed to verify that the workflow executes correctly and that the email contains the appropriate claim details.

# 2. Procedure

**Step 1: Select the existing form**

The existing Insurance Claim Request Form was selected from the Forms section of the Zoho Creator application. The form contains the information required to process an insurance claim, including claimant details, policy number, claim type, and claim amount.

**Step 2: Create a workflow**

A new workflow was created under the Workflow section of Zoho Creator. The existing Insurance Claim Request Form was selected as the form on which the workflow would execute.

**Step 3: Configure the workflow trigger**

The Record Event was configured as Created, and the Form Event was set to On Submission / Successful Form Submission. This ensures that the workflow runs when a new claim is submitted successfully.

**Step 4: Name the workflow**

The workflow was named Send Insurance Claim Confirmation Email. This name identifies the purpose of the automation and makes the workflow easy to locate and manage.

**Step 5: Add a Deluge script action**

Under the workflow actions, Deluge Script was selected as the action type. This allows the application to generate an email dynamically using information entered in the Insurance Claim Request Form.

24140164

**Step 6: Write the Deluge script**

A Deluge script using the sendmail task was written to send an automated confirmation email to the claimant. The script uses the claimant's email address as the recipient and includes relevant information such as the claimant's name, policy number, claim type, and claim amount.

The field link names used in the script were matched with the corresponding fields in the existing form.

**Step 7: Save the workflow**

The Deluge script was saved, and the workflow configuration was reviewed to ensure that the email action was attached to the correct form submission event.

**Step 8: Test the application**

A test insurance claim was submitted through the form using sample claimant details, a policy number, a claim type, and a claim amount. A valid email address was entered to verify the automated notification.

**Step 9: Debug and verify the output**

The recipient's inbox was checked to confirm that the automated confirmation email was received. The email subject and message content were reviewed to ensure that the workflow executed correctly and that the submitted claim details appeared as expected.

# 3. Output

## 3.1 Creating the workflow — trigger configuration

The workflow configuration screen shows the Insurance Claim Request Form selected with the Record Event set to Created and the Form Event set to successful form submission. The workflow was named Send Insurance Claim Confirmation Email.

This configuration specifies when the automation should run.

## 3.2 Selecting the action type

The Add New Action section was used to select Deluge Script as the action type. This action allows the workflow to send a personalized email using values entered in the insurance claim form.

## 3.3 Writing the Deluge script

The Deluge editor was used to write a sendmail script that sends an insurance claim confirmation email. The script dynamically retrieves the claimant's email address and relevant claim information from the submitted form record.

The email subject was set to “Insurance Claim Submission Confirmation,” and the message informed the claimant that the claim request had been received.

## 3.4 Saving the workflow

After the script was saved, the workflow configuration was checked to verify that the Deluge action was attached to the Insurance Claim Request Form and configured to execute upon successful submission.

## 3.5 Testing with a form submission

A test insurance claim was submitted through the live or preview form. Sample information was entered into the claimant details, policy number, claim type, and claim amount fields.

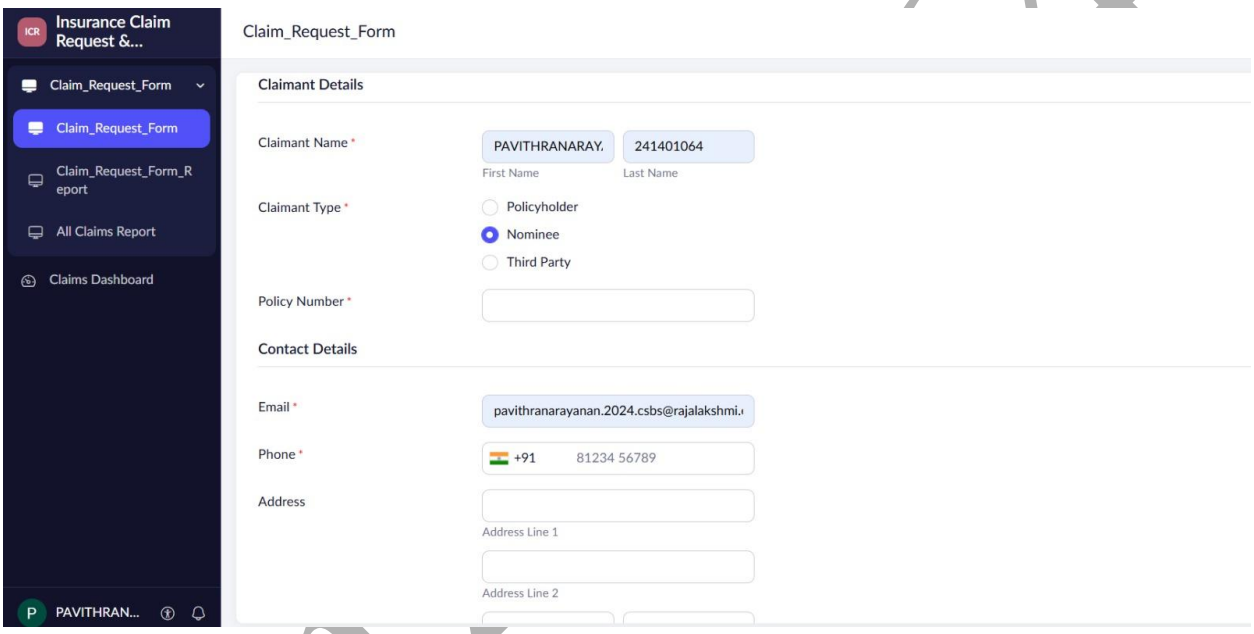

The submission was used to trigger the workflow and verify that the automation ran without requiring manual intervention.

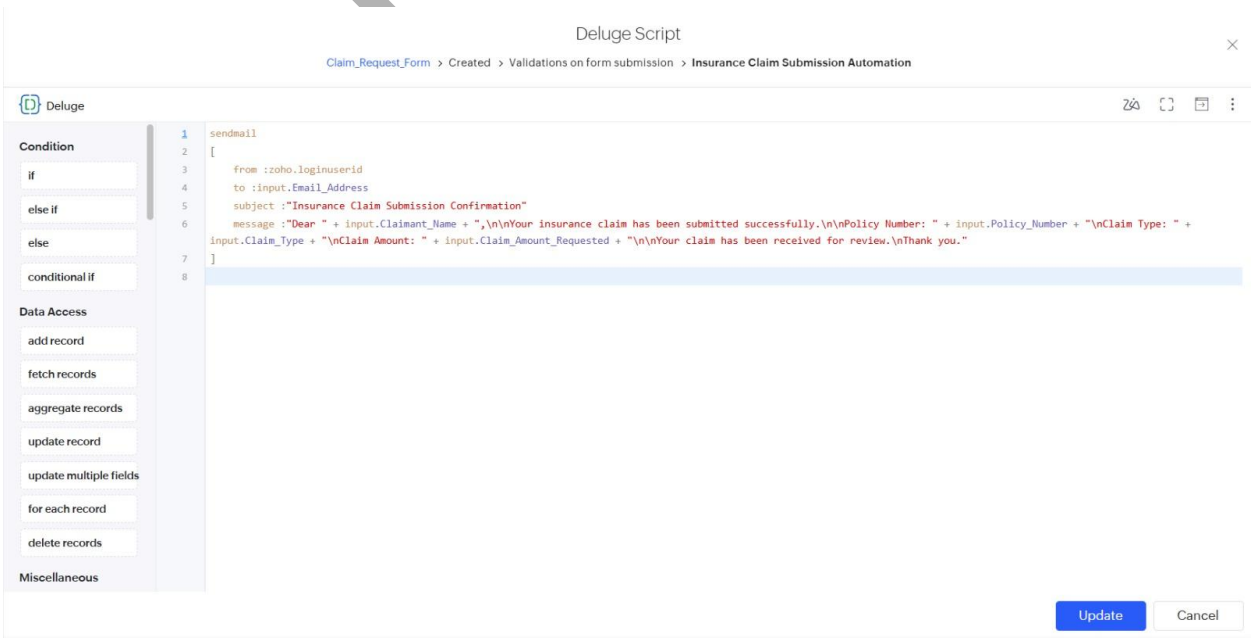

2140164

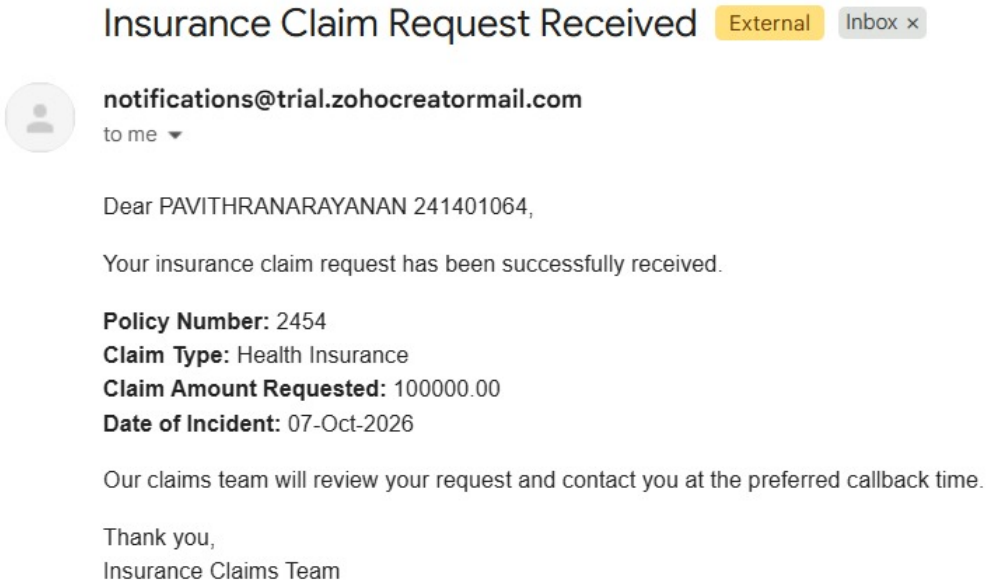

## 3.6 Debugging output — confirmation email received

The email inbox was checked after the form submission. The confirmation email was received with the configured subject and message.

The output was reviewed to confirm that the recipient address was correct and that the relevant claim details were displayed correctly. Any field-name errors encountered during implementation were corrected by matching the script variables with the actual field link names in Zoho Creator.

to me

Dear PAVITHRANARAYANAN 241401064,

Your insurance claim request has been successfully received.

**Policy Number:** 2454
**Claim Type:** Health Insurance
**Claim Amount Requested:** 100000.00
**Date of Incident:** 07-Oct-2026

Our claims team will review your request and contact you at the preferred callback time.

Thank you,
Insurance Claims Team

## 4. Application Testing and Debugging

The workflow was tested using the following test cases.

| Test Case | Test Description | Expected Result |
|---|---|---|
| TC01 | Submit a valid insurance claim | Claim record is created successfully |
| TC02 | Submit a claim with a valid email address | Confirmation email is sent |
| TC03 | Verify the email subject | Correct confirmation subject is displayed |
| TC04 | Verify the email body | Claim details are displayed correctly |
| TC05 | Use an incorrect field link name in the script | Error is identified and corrected |
| TC06 | Submit another valid claim | Workflow runs for the new submission |

The main debugging issue encountered during implementation was an undefined variable error caused by using an incorrect email field link name. The issue was resolved by checking the field link name in the form properties and updating the Deluge script accordingly.

After the correction, the script executed successfully and the confirmation email was received.

## 5. Final Result

The Insurance Claim Request Form was successfully integrated with a Zoho Creator workflow using Deluge scripting. The workflow automatically sends a confirmation email to the claimant when a new insurance claim request is submitted successfully.

The application was tested using a sample claim submission, and the resulting email was checked to verify the automation. The field-name error encountered during development was corrected, and the email notification worked as expected.

Thus, the experiment demonstrated the use of Deluge scripting, workflow automation, application testing, and debugging to automate an insurance claim submission process in Zoho Creator.
