Insurance Claim Request & Processing Management

Name	Pavithra Narayanan
Roll No	241400164
Department	CSBS
Date	11-Aug-2026

Aim

To design and develop a functional Insurance Claim Request Form using Zoho Creator, demonstrating the use of all thirteen Basic Fields available in the Form Builder. The application is designed to collect structured insurance claim information from policyholders, nominees, or third parties, apply appropriate field validations, store submitted claim records, and send an automated acknowledgement email after successful submission.

Procedure

1. Create the Zoho Creator Application

1. Open Zoho Creator and create a new application.
2. Name the application Insurance Claim Request & Processing Management.
3. Create a new form named Claim_Request_Form.

2. Design the Claim Request Form

The form was divided into four logical sections:

Section A – Claimant Details

- Claimant Name – Name field
- Claimant Type – Radio field
- Policy Number – Single Line field

Section B – Contact Details

- Email Address – Email field
- Contact Number – Phone field
- Residential Address – Address field

Section C – Claim Details

- Claim Type – Drop Down field
- Date of Incident – Date field
- Claim Amount Requested – Number field
- Supporting Documents Available – Multi Select field
- Incident Description – Multi Line field

Section D – Scheduling & Declaration

- Preferred Callback Time – Time field
- Declaration of Authenticity – Checkbox field

3. Configure the Basic Fields

All thirteen Basic Field types were added to the form:

4. Name
5. Email
6. Address
7. Phone
8. Single Line
9. Multi Line
10. Number
11. Date
12. Time
13. Drop Down
14. Radio
15. Multi Select
16. Checkbox

4. Configure Field Validations

The required fields were marked as mandatory. Additional validations were configured as follows:

- Email Address was configured using the Email field's built-in format validation.
- Contact Number was configured for Indian phone numbers.
- Claim Amount Requested was validated to accept only positive values.
- Date of Incident was validated to prevent future dates.
- Declaration of Authenticity was made mandatory so that the form cannot be submitted without confirmation.
- Claim Type and Claimant Type were configured with predefined choices.

5. Configure Claim Amount Validation

A Validation on Form Submission workflow was created using Deluge. The workflow checks whether the requested claim amount is zero or negative. If the value is invalid, an error message is displayed and submission is cancelled.

6. Configure Incident Date Validation

A validation workflow was configured to compare the entered incident date with the current date. If the incident date is in the future, the form displays an error message and prevents submission.

7. Create the Claim Request Report

A report named Claim_Request_Report was created to display all successfully submitted claim requests. The report allows the claims team to review submitted information such as:

- Claimant Name
- Policy Number
- Claim Type
- Date of Incident
- Claim Amount
- Claimant Type
- Contact Number

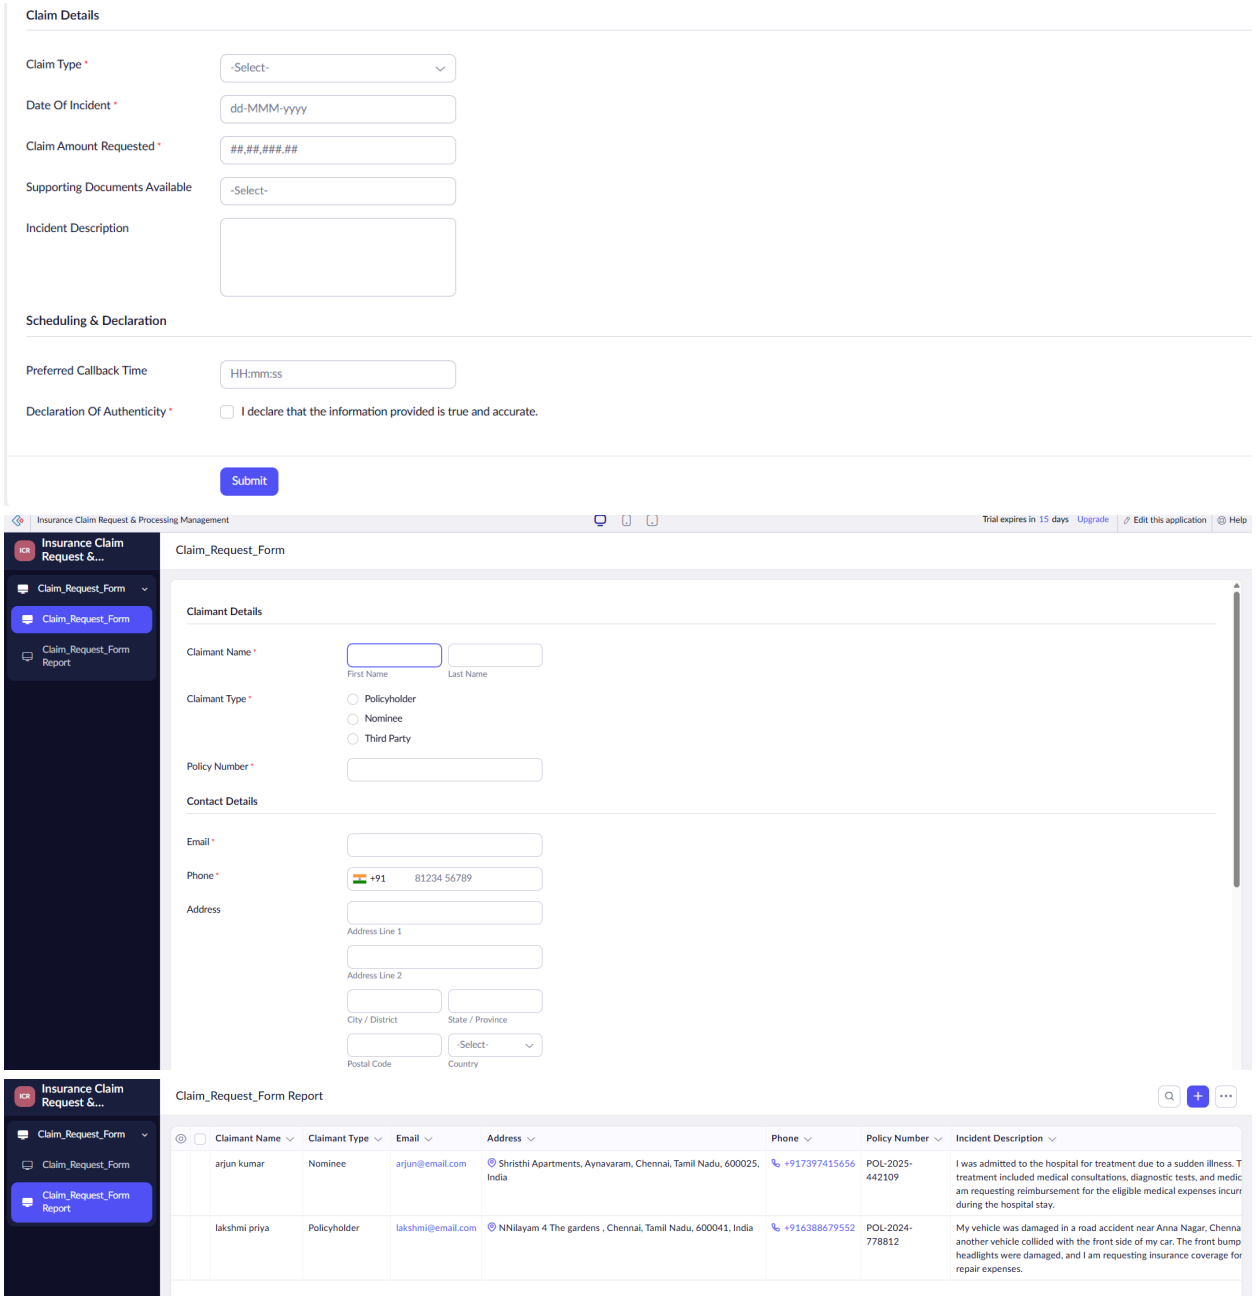

8. Configure the Acknowledgement Email

A workflow was created for successful form submission. After a valid claim request is submitted, Zoho Creator automatically sends an acknowledgement email to the email address entered by the claimant. The email contains relevant claim information such as the claimant name, policy number, claim type, claim amount, and incident date.

9. Test the Application

The completed form was tested using sample claim requests for different claim types, including Motor Insurance and Health Insurance. At least three valid records were submitted and verified in the Claim_Request_Report. Invalid values such as a negative claim amount and a future incident date were also tested to verify that the configured validations work correctly.

Output

Result

Thus, the Insurance Claim Request & Processing Management application was successfully designed and developed using Zoho Creator.

The Claim_Request_Form successfully demonstrated all thirteen Basic Fields, including Name, Email, Address, Phone, Single Line, Multi Line, Number, Date, Time, Drop Down, Radio, Multi Select, and Checkbox.

The required field validations were implemented, including positive claim amount validation and prevention of future incident dates. Submitted claim requests were successfully stored and displayed in the Claim_Request_Report. An automated acknowledgement email was also configured to notify the claimant after successful submission.

Hence, the application successfully provides a structured low-code solution for collecting and pre-processing insurance claim requests.
